

SENSIGHT in collaboration with VALEO unveils a new device to manage electric car passengers' wellness and comfort

The young French startup will exhibit their unique and innovative industrial vision systems during Consumer Electronic Show (CES) - Las Vegas – January 9/12th 2018.

Meylan, January 3rd 2018 – *“Imagine a way to easily manage electric car passengers' wellness and comfort without impacting battery operating life. Here is the undertaking of VALEO in collaboration with SENSSIGHT which exhibits an embedded vision system inside an EV vehicle. The infrared vision devices, developed by SENSSIGHT, capture cabin thermal environment metrics as long as driver's heat stress for a better driving experience even in harsh winter conditions.”* said Lionel CHAVEROT – Managing director at SENSSIGHT.

From smart transport to home appliances

Expert in real time embedded vision systems, SENSSIGHT will exhibit, in less than one year after its launch, several demonstrators for various applications: from automotive to home appliances through security devices and industrial maintenance. By providing turn key solutions to industrials, SENSSIGHT offers unique vision devices that detect, enhance and analyze events such as: hot/cold spots, animal/human intrusion, people density, water leakage, store attendance rate, ...

From vision to valuable data

Vision is the starting point. Whether we have to detect people, animal or object during day or night, SENSSIGHT determines the best hardware that fulfills customer's constraints. This could lead to select a visible camera, an infrared one or a combination. Then to maximize performance/cost ratio, SENSSIGHT adds specific algorithms that filter and extract the valuable data out of the video stream (detection, counting, localization, direction, temperature, shape, ...). Our added value is to provide a solution that is the best trade off between hardware and software costs. Therefore, we answer the question: “how much does it cost to perform such marketing use case functions?” By partnering with SENSSIGHT, industrials are accompanied from proof of concept to final product development.

First birthday, first products

SENSSIGHT will also exhibit two products:

- A thermal monocular: an autonomous and portable device that detects and follows intrusion over 150 meters. Whether it is an animal, a human or a vehicle it will be difficult to escape its detection due to its embedded A.I software.
- A thermal industrial endoscope: the tiniest, hardened and wireless thermal endoscope with best-in class performances/price ratio that monitors and detects various events to take preventive actions.

About SENSSIGHT

SENSSIGHT is a technology and innovation company specializing in the development and the licensing of advanced industrial vision systems for industrial markets. Think different and deliver is a motto that makes us unique in the market. Our turnkey solutions open a wide area of collaboration starting from optic choice, to software and firmware development, going through electronic design. Founded in January 2017 and based in Meylan, France, SENSSIGHT is expert in imaging technology for automotive, industrial maintenance, security, home appliances, smart building, and smart cities. Fueled by passion and commitment, SENSSIGHT team is always looking at disruptive and innovative solutions, to bring added value and differentiation to our customers.

Our goal is to become a major international player in industrial vision within 5 years.
